

SMART INDIA HACKATHON 2026

TITLE PAGE

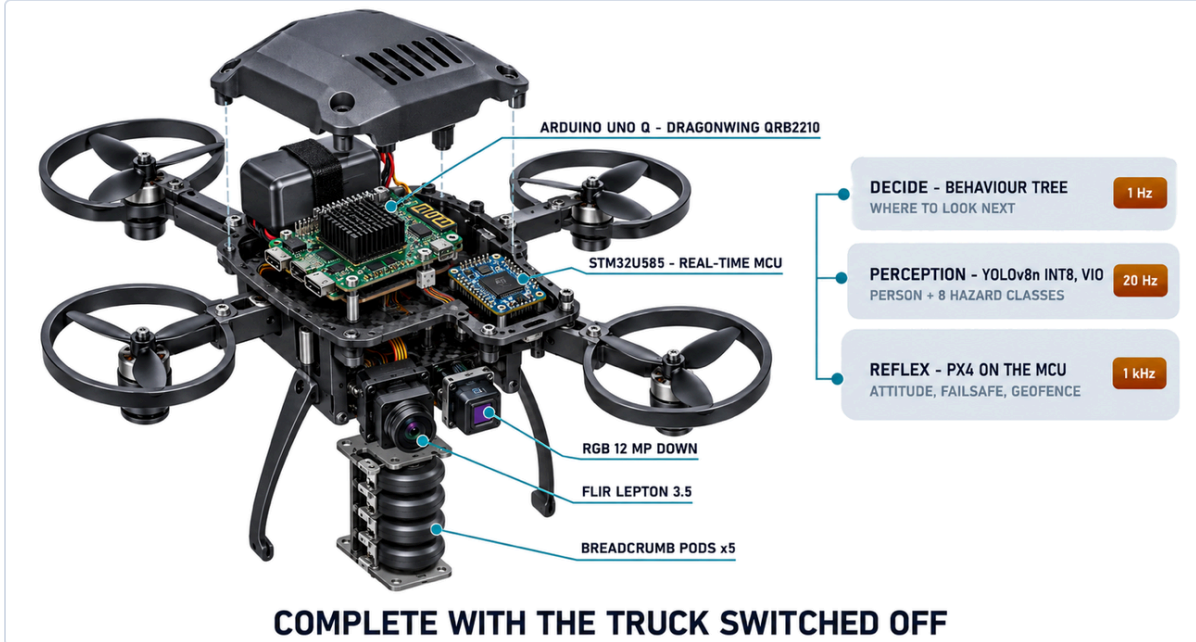

- **Problem Statement ID** – 26177
- **Problem Statement Title** – A deployable AI-powered autonomous drone that aids search-and-rescue operations by detecting people and hazards, thereby improving responder safety and reducing victim discovery time.
- **Theme** – Robotics and Drones
- **PS Category** – Hardware
- **Team ID** –
- **Team Name** – Drone Syndicate

PROPOSED SOLUTION

At Wayanad, 206 people were never found. Not because nobody looked. It was because 1,300 responders could not cover 15 km² before the window closed.

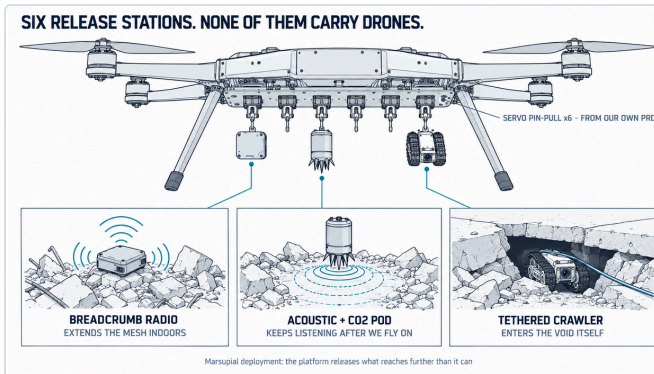

① ONE AIRCRAFT · COMPLETE WITH THE TRUCK SWITCHED OFF

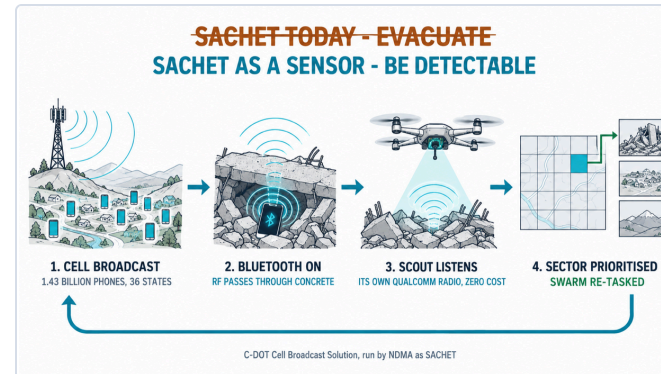

② SIX OF THEM · 15 KM² SWEEPED IN 5.8 HOURS

③ ONE AIRCRAFT, THREE PAYLOADS

④ THE IDEA NOBODY HAS USED

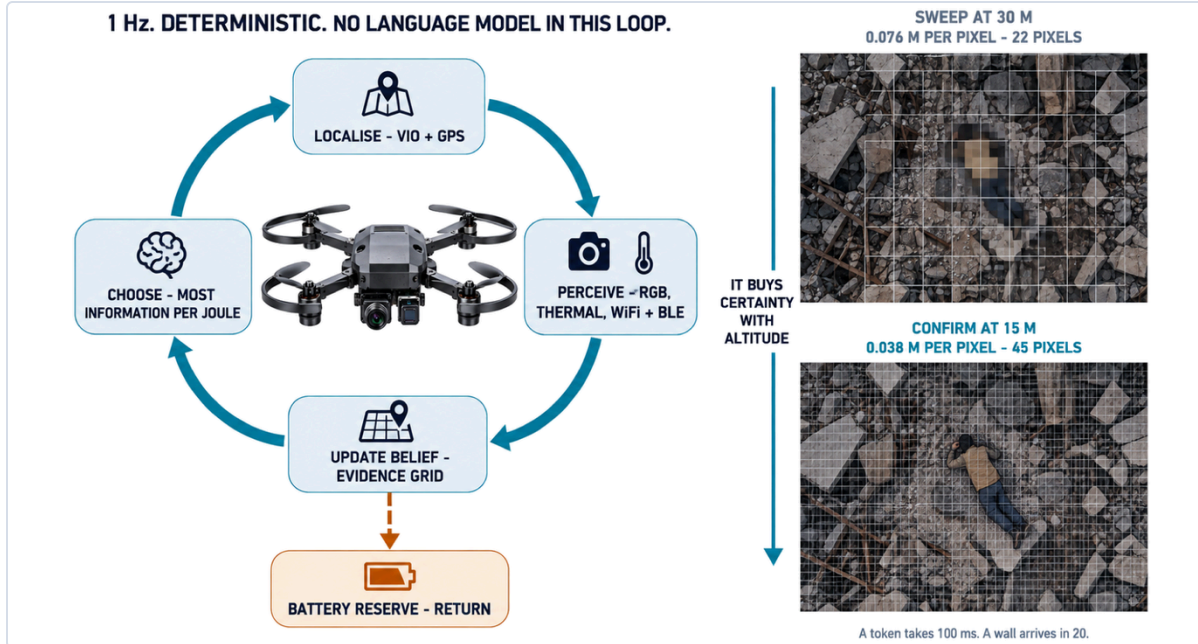

◆ Proposed Solution (Describe your Idea/Solution/Prototype)

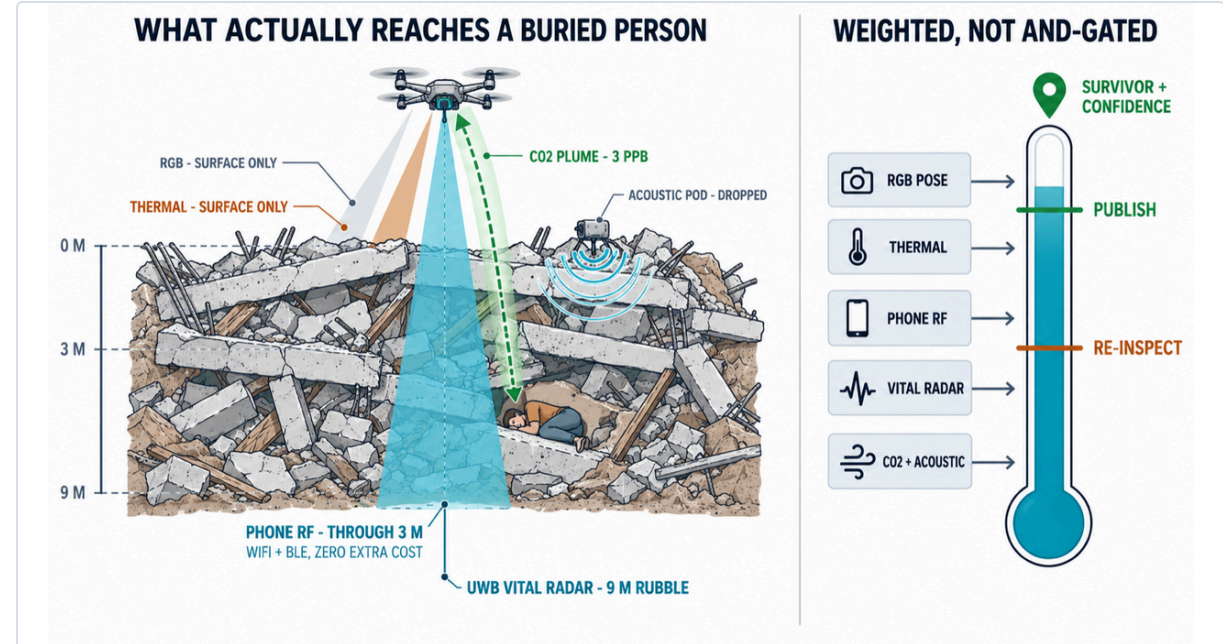

- Detailed explanation:** One scout is an **Arduino UNO Q** (Qualcomm Dragonwing QRB2210 + real-time STM32U585) carrying RGB, thermal and its own Wi-Fi/BLE radio. PX4 flies on the MCU at 1 kHz; detection, odometry and the decision tree run on Linux. **It is not only a swarm.** A single aircraft also carries swappable payloads: breadcrumb radios, acoustic and CO₂ pods, a tethered crawler. The truck is an accelerator, never a dependency.
- How it addresses the problem:** Wayanad 2024: 1,300 responders, 6 zones, **5+ days**, 206 never found. One scout sweeps 0.43 km²/h alone; six sweep the full 15 km² in **5.8 hours**, for **+64 survivors per 100 trapped**.
- Innovation and uniqueness:** **SACHET cell broadcast, inverted.** NDMA already reaches 1.43 bn handsets to say *evacuate*. One message saying *turn Bluetooth on* makes every phone a beacon, and the scout's own Qualcomm radio is already the receiver. **Zero added hardware.**

Detection is off-the-shelf. The decision layer is ours, and it is measured on Qualcomm silicon.

① HOW ONE AIRCRAFT DECIDES · 1 HZ, DETERMINISTIC

② WHAT ACTUALLY REACHES A BURIED PERSON

RUNS IN THE JUDGE'S BROWSER

◆ Technical Approach

SILICON Dragonwing QRB2210 QCS6490 IQ-8275 STM32U585 AI YOLOv8n INT8 Qualcomm AI Hub QNN MobileCLIP FLIGHT PX4 ROS 2 VINS-Fusion VIO

RADIO Wi-Fi 5 BT 5.1 LoRa SX1262 breadcrumb relays

- **Methodology: Four algorithms, not a wrapper.** (1) two-pass descent, SAHI-style, with min-window-cover crop planning, union-find cross-pass merging and weighted box fusion · (2) correlated Bayesian fusion solving $\Sigma w = 1$, which discounts sensors that fail together and reduces to Chair-Varshney when they do not · (3) prize-collecting **Held-Karp** route DP, exact, battery reserve inside the DP · (4) 0/1 knapsack for the LoRa frame. **9/9 self-tests against brute force.**
- **Measured, not estimated:** YOLOv8n INT8 @640 on **Qualcomm AI Hub**, **real devices:** Arduino Ventuno Q (IQ-8275) **1.85 ms / 539 FPS**; Dragonwing RB3 Gen 2 (QCS6490) **11.21 ms / 89 FPS. 247 of 247 layers on the Hexagon NPU, zero CPU fallback.** The sweep needs 0.22 Hz, so the headroom runs detection, VIO and the radio scanner at once.

We built four architectures, scored them against our own criteria, and shipped the one that survives losing pieces.

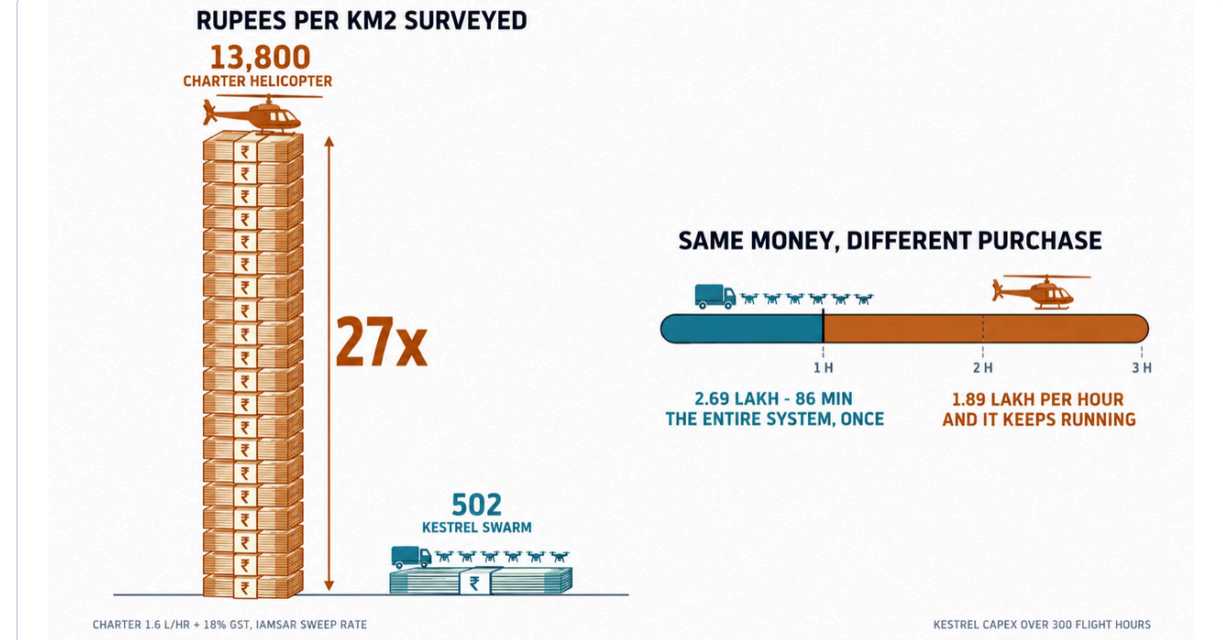

① THE ALTERNATIVES WE TESTED · AND WHY OURS WON

FOUR WAYS TO BUILD THIS. WE TESTED OURS.

Evidence: Zhejiang Science Robotics 2022; CERBERUS DARPA SubT; ACHORD; market-based replanning 2026

② WHAT IT COSTS AGAINST THE ALTERNATIVE

③ WHEN PIECES FAIL

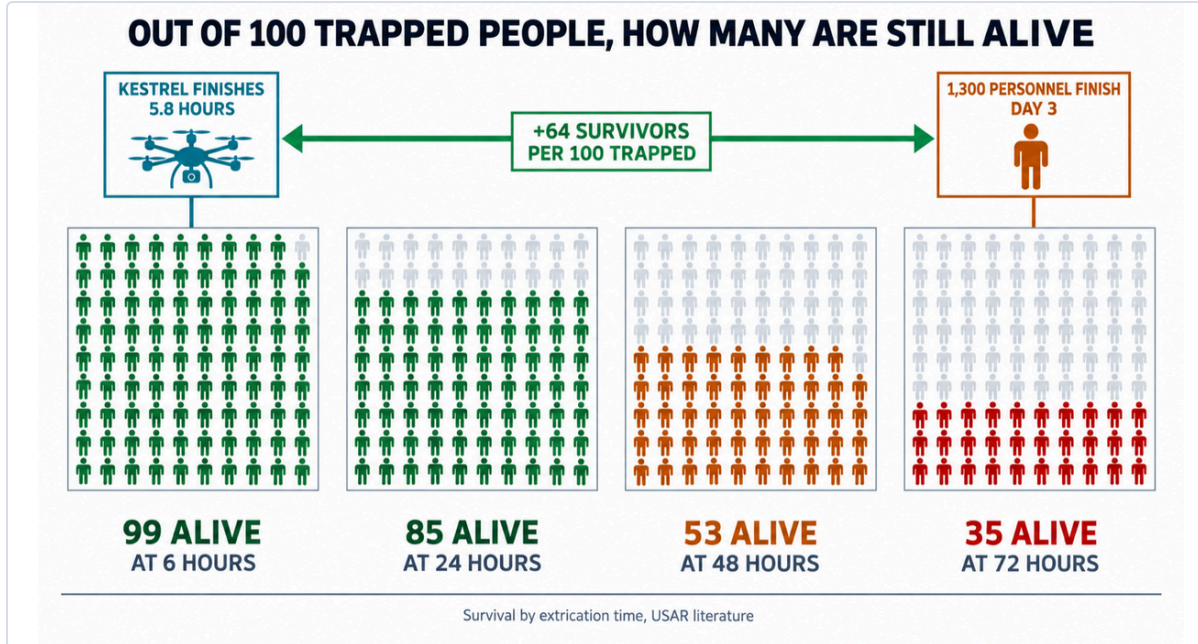

◆ Feasibility and Viability

- Feasibility:** ₹2.68 lakh total, Indian-vendor sourced (Robu / Robocraze / Thundercomm). That is **86 minutes** of charter helicopter. Airframe, flight stack and radios are all commodity; the detector is already profiled on real Qualcomm hardware.
- Potential challenges and risks:** Thermal **inverts** on sun-heated rubble in daylight · VIO drifts ~0.5% of path, which is 21 m over a full sortie · FINDER-class radar **reported three breath signals at Wayanad where nothing was found** · a 500 mm airframe cannot enter a collapsed doorway.
- Strategies for overcoming them:** Independence weighting means **no single stream ever decides**. The radar that lied is one weighted vote · GPS-denied excursions are bounded to 1–3 min by breadcrumb anchors and loop closure at the truck, giving **1.2–3.6 m**, inside the re-inspect radius · interiors are reached by **dropped breadcrumb pods**, not by flying the sweep frame indoors · and the degradation ladder is designed so the system gets **slower, never offline**.

IMPACT AND BENEFITS

The 72-hour window is the entire problem. We move first contact from day three to hour six.

① OUT OF 100 TRAPPED PEOPLE, HOW MANY ARE STILL ALIVE

② WHAT THE COMMANDER SEES · ON-DEVICE, NO NETWORK

③ WHAT IT IS ALL FOR

◆ Impact and Benefits

- Impact on the target audience:** NDRF, SDRF and the Army search at roughly $0.1 \text{ km}^2/\text{h}$ per team. Kestrel sweeps $2.6 \text{ km}^2/\text{h}$. On the Wayanad footprint that is **5.8 hours instead of five days: 99 alive per 100** at six hours against **35 at seventy-two**.
- Social:** Responders stop walking unstable debris and live power lines to find out whether anyone is there. The aircraft takes that risk, and it takes it at night, in monsoon, without fatigue.
- Economic:** ₹502 per km^2 against ₹13,800 by charter helicopter, **27×**. Equipping all **738 districts** costs $\approx$ ₹19.86 Cr, which is **0.12%** of the national disaster preparedness line. It is already funded; it is a procurement decision, not a budget request.
- Environmental:** Battery-electric, no fuel burn, and the scout's brain is a ₹5,190 board rather than a ₹50,000 one.

Every number in this deck traces to a source. Every claim about our own silicon is a job ID you can open.

PEER-REVIEWED & FIELD EVIDENCE

- Team **CERBERUS**, winner, DARPA Subterranean Challenge 2021: base-station compute + breadcrumbed radio nodes

QUALCOMM PLATFORM & OUR OWN MEASUREMENTS

- Qualcomm AI Hub**: YOLOv8n INT8 @640, QNN DLC, --quantize_io, profiled on physical devices
- Arduino **Ventuno Q** (Dragonwing IQ-8275, Hexagon v75): **1.85 ms · 539 FPS · 247/247 NPU**
- Dragonwing **RB3 Gen 2** (QCS6490, Hexagon v68): **11.21 ms · 89 FPS · 247/247 NPU**
- Arduino **UNO Q**: QRB2210 + STM32U585, Wi-Fi 5 + BT 5.1, ₹5,190 (4 GB / 32 GB)
- PX4 / ROS 2 / VINS-Fusion**: open flight and odometry stack
- Third-party*: Foundries.io measured YOLOv5 Pico at **~17 FPS** on a physical UNO Q
- SARD** search-and-rescue aerial dataset: 1,980 images, 6,525 person instances, fine-tune in progress
- ONNX Runtime Web**: the demo executes in the judge's browser, no server and no upload
- Honest limit*: **QRB2210 is not offered on AI Hub**, so the scout figure stays third-party

OUR OWN MEASUREMENTS · QUALCOMM AI HUB, PHYSICAL DEVICES, JOB IDS ON REQUEST
